

# Assessing Context in Implementation Research Using Qualitative Methods

## Key Takeaways:

- Context is dynamic and multi-level, and therefore may require multiple methods to assess.
- These qualitative methods might include ethnography, co-creating theories of change, and brainwriting pre-mortem.
- Assessing at multiple points (pre-implementation, mid-implementation, etc.) over time is also important.
- A semi-structured approach (e.g., with templates) to assessing context works well with team-based data collection and analysis.
- Theories, models, and frameworks (TMF) can and should support assessment of context, but it's important to make space for emergent discovery (i.e., discovery that doesn't necessarily align with TMF).
